WOAH Collaborative Centre Reports Activities 2023

Activities in 2023

This report has been submitted: 15 juillet 2024 15:58

Centre Information

| Title of WOAH Collaborating Centre | Detection and identification in Humans of emerging Animal Pathogens and Development of Tools for their Diagnoses |
| Address of WOAH Collaborating Centre | Institut PASTEUR, 28 rue du docteur ROUX 75724 Paris ceds 15, France |
| Tel: | +33 1 40 61 38 08 |
| E-mail address: | jean-claude.manuguerra@pasteur.fr |
| Website: | www.pasteur.fr |
| Name Director of Institute (Responsible Official): | Yasmin BELKAID |
| Name (including Title and Position) of Head of the Collaborating Centre (WOAH Contact Point): | Dr Jean-Claude MANUGUERRA DVM, PhD, HDR - Research director - Head of the `Environment and infectious risks” and of the Laboratory for urgent response to biological threats - Deputy head of the French National reference centre for hantaviruses |
| Name of the writer: | Jean-Claude MANUGUERRA |

TOR1 AND 2: SERVICES PROVIDED

1. Activities as a centre of research, expertise, standardisation and dissemination of techniques within the remit of the mandate given by WOAH

<table>
<thead>
<tr>

<tr>
<td>Training, capacity building (true)</td>
<td>1/ Regional Workshop on Multidisciplinary field outbreak investigation 2/ Workshop «Metagenomic Technologies» for the MediLabSecure Network 3/ Training on serosurveillance of emerging viruses in wildlife avifauna</td>
<td>1/ A workshop on Mobile laboratories and field diagnostic was organized in Tunis in September 2023 in the framework of the MediLabSecure project. This workshop included human virologists (4) and medical entomologist (4) from 3 countries of North Africa (Tunisia, Libya, and Algeria). The workshop was dedicated to the detection and surveillance of WNV using point-of-Care diagnostic tools and NGS sequencing. 2/ Two workshops on “Metagenomic Technologies” were held at Institut Pasteur in Paris in April and May 2023. The objective was to train scientists on sequencing and data analysis using metagenomic approaches. These workshops included 22 participants from animal virology (10), human virology (10) and medical entomology (2) sectors from 16 countries belonging to MediLabSecure network. 3/ A 2-week training course on the serological screening of sentinel wild bird populations using MMIA (Multiplex Microsphere-based immune-assay) was provided to the Institut Pasteur of French Guiana.</td>

<td>• Orthoebolavirus in porcine populations of Guinea -</td>
</tr>
</tbody>
</table>
Pigs are naturally susceptible to Reston virus and experimentally to Ebola virus (EBOV), but their role in Orthoebolavirus ecology remains unknown. We tested 888 serum samples collected from pigs in Guinea during 2017-2019 (between the 2013-16 epidemic and its resurgence in 2021) by indirect ELISA and in house MMIA against EBOV nucleo- and glycoproteins. We identified 2 hotspots of possible pig exposure by IgG titer levels: the northern coast had 48.7% of positive serum samples, and Forest Guinea, bordering Sierra Leone and Liberia, where the virus emerged and reemerged, had 50% of positive serum samples. Those results are consistent with previous observations of the circulation of Orthoebolavirus species in pig farming regions in Sierra Leone and Ghana, suggesting potential risk for Ebola virus disease in humans, especially in Forest Guinea.

- Orthopoxviruses in domestic animals and cattle of Guinea - Following 3 sample collection campaigns conducted in 2023, sera from over 300 pigs, 400 dogs, 299 Caprines, 111 ovines and 157 bovines were collected from different regions of Guinea. The biobank was screened using an in-house multiplex immunoassay targeting antibodies against 32 surface proteins of human pathogenic orthopoxviruses, including MonkeyPox virus. The analysis of seroprevalence rates in the different host populations is currently ongoing.

- Rift Valley fever virus in wild and domestic animals in Gabon - Although the Rift Valley fever virus (RVFV) transmission cycle has been well documented across Africa in savanna ecosystems, little is known about its transmission in tropical rainforest settings, particularly in Central Africa. We therefore conducted a survey in northeastern Gabon to assess RVFV circulation among wild and domestic animals. Among 163 wildlife samples tested using RVFV-specific RT-qPCR, four ruminants belonging to subfamily Cephalophinae were detected positive. The phylogenetic analysis revealed that the four RVFV sequences clustered together with a virus isolated in Namibia within the well-structured Egyptian clade. A cross-sectional survey conducted on sheep, goats and dogs living in villages within the same area determined the IgG RVFV-specific antibody prevalence. Out of the 306 small ruminants, an overall antibody prevalence of 15.4% was observed with a higher rate in goats than in sheep (20.1% versus 3.3%). RVFV-specific antibodies were detected in a single dog out of the 26 tested. Our findings highlight sylvatic circulation of RVFV for the first time in Gabon.

- Japanese encephalitis in pig-raising communities in Bangladesh - Japanese encephalitis virus (JEV) circulates endemically in Bangladesh and the country is set to introduce JEV vaccine. However, knowing how best to deploy the vaccine has been hampered by an insufficient understanding of key aspects of JEV ecology, including the spatial heterogeneity in risk, and risk factors for infection. We conducted a national seroprevalence study where we visited 110 communities around the country and collected blood from randomly selected individuals (N=2938). The blood was tested for anti-JEV IgG antibodies using a novel in house MMIA test that limits cross-reactivity with dengue virus. We found 3.4% of participants had antibodies against JEV, and
estimated that on average 215,000 people get infected each year. Infection risk was greatest around pig-raising communities. This study provides the basis to identify regions in the country where vaccine deployment would be most beneficial and, will allow us to assess the impact of different approaches in terms of health outcomes (infections, cases, deaths, and disability life-years averted) per doses used.

Urban rat-associated zoonotic pathogens

The objective was to document the presence and diversity of zoonotic pathogens among urban brown rat populations (Rattus norvegicus) and to determine the rat associated public health risks. Tissue samples from 700 brown rats trapped in seven French cities (2021-2024) in the framework of three scientific projects: ARMAGUEON (Assessment of Rats Management Associated to a Genomics-Urban Ecology-Disease Occurrence Network in Paris; ANR funded), Rat en ville -Eurométropole de Strasbourg (CNR Hantaviruses funded) and RATVAR (Evaluation of the receptivity, susceptibility and transmission potential of the Murinae subfamily to SARS-CoV-2 variants; ANRS-MIE funded), will be tested for infection with bacteria (including Leptospira interrogans, Yersinia spp, Streptobacillus moniliformis, Rickettsia typhi, Borrelia spp.) and viruses (including Hantaviruses (particularly Seoul virus), rat hepatitis E virus, coronaviruses, orthopoxviruses and Lymphocytic choriomeningitis virus). Work is still in progress.

TOR3: HARMONISATION OF STANDARDS

2. Proposal or development of any procedure that will facilitate harmonisation of international regulations applicable to the main focus area for which you were designated

<table>
<thead>
<tr>
<th>Proposal title</th>
<th>Scope/Content</th>
<th>Applicable area</th>
</tr>
</thead>
<tbody>
<tr>
<td>Heat inactivation of monkeypox virus</td>
<td>Different kinds of media spiked with monkeypox virus (MPXV) were subjected to heat inactivation at different temperatures for various periods of time. The results showed that MPXV was inactivated in less than 5 min at 70 °C and less than 15 min at 60 °C, with no difference between viruses from the West African and Central African clades. The present findings could help laboratory workers to manipulate MPXV in optimal biosafety conditions and improve their protocols.</td>
<td>Laboratory expertise</td>
</tr>
</tbody>
</table>

3. In exercising your activities, have you identified any regulatory research needs* relevant for WOAH?

No

4. Did your Collaborating Centre maintain a network with other WOAH Collaborating Centres (CC), Reference Laboratories (RL), or organisations designated for the same specialty, to coordinate scientific and technical studies?

Yes

<table>
<thead>
<tr>
<th>Name of WOAH CC/RL/other organisation(s)</th>
<th>Location</th>
<th>Region of networking Centre</th>
<th>Purpose</th>
</tr>

<td>Europe</td>
</tr>
<tr>
<td></td>
<td></td>
<td></td>
<td>FLI and I. Pasteur are 2 core members of the new project for the European Health Emergency Preparedness and Response Authority (HERA): Delivering a Unified Research Alliance of Biomedical and public health Laboratories against Epidemics.</td>
</tr>
</tbody>
</table>

TOR4 AND 5: NETWORKING AND COLLABORATION

5. Did your Collaborating Centre maintain a network with other WOAH Collaborating Centres, Reference laboratories, or organisations in other disciplines, to coordinate scientific and technical studies?

Yes

<table>
<thead>
<tr>
<th>Name of WOAH CC/RL/other organisation(s)</th>

<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>WOAH Collaborating Centre for Risk Analysis and Modelling (UK’s Animal and Plant Health Agency (APHA) and the Royal Veterinary College)</td>
<td>London, UK</td>
<td>Europe</td>
<td>Contact have been continued to explore opportunities for collaboration to achieve expected deliverables more effectively.</td>
</tr>
</tbody>
</table>
TOR6: EXPERT CONSULTANTS

6. Did your Collaborating Centre place expert consultants at the disposal of WOAH?

Yes

<table>
<thead>
<tr>
<th>NAME OF EXPERT</th>
<th>KIND OF CONSULTANCY</th>
<th>SUBJECT</th>
</tr>
</thead>
<tbody>
<tr>
<td>1/ Jean-Claude MANUGUERRA 2/ Jean-Claude MANUGUERRA and Jessica VANHOMWEGEN</td>
<td>1/ WOAH ad hoc group: Covid-19 at the animal-human interface 2/ Principal drafters of the WOAH case definition: Crimean-Congo Haemorrhagic Fever</td>
<td></td>
</tr>
</tbody>
</table>

TOR7: SCIENTIFIC AND TECHNICAL TRAINING

7. Did your Collaborating Centre provide advice/services to requests from Members in your main focus area?

No

8. Did your Collaborating Centre provide scientific and technical training, within the remit of the mandate given by WOAH, to personnel from WOAH Members?

Yes

a) Technical visit: 1
b) Seminars: 0
c) Hands-on training courses: 1
d) Internships (>1 month): 0

<table>
<thead>
<tr>
<th>TYPE OF TECHNICAL TRAINING PROVIDED (A, B, C OR D)</th>

TOR9: DATA AND INFORMATION DISSEMINATION

10. Publication and dissemination of any information within the remit of the mandate given by WOAH that may be useful to Members of WOAH

a) Articles published in peer-reviewed journals:

b) International conferences:

- QCMD Board Meeting, Glasgow, February 2023
  - The importance of External Quality Assessments in preparedness and response to emerging vector borne diseases: the MediLabSecure experience

- Conference du Conseil Scientifique de l’Institut Pasteur de Tunis, Tunis, Friday 28 April 2023
  - Faire face aux défis du diagnostic biologique au début de l’émergence de maladies nouvelles ou ré surgent

- 8th European Congress of Virology 2023, Gdansk, Poland, Friday 5 May 2023
  - Innovative diagnostics in virus surveillance

- London Calling, Oxford Nanopore Technologies, London (UK), 17-19 May 2023
  - Operational strategy for rapid detection and characterization of emergent viral pathogens using third generation sequencing technologies

- 10th European Meeting on Viral Zoonoses, St-Raphael (France), 23-26 September 2023
  - Persistence of Mpxov viruses on various surfaces

- Medical Biodefense Conference, Munich, October 2023
  - Network for promoting a One Health approach to mitigate biological risks related to emerging vector borne viruses in the Mediterranean, Black Sea & Sahel regions

- International Symposium on Emerging and Re-emerging Zoonotic Diseases, Mbour (Sénégal), 9-11 October 2023
  - Detecting and differentiating past exposure to zoonotic viruses using microsphere immunoassays: applications in hyperendemic areas

- 28th UN Climate Change Conference (COP28), Dubai, United Arab Emirates, 30 November – 12 December 2023
  - The Institut Pasteur, a key player in tomorrow’s biomedical research

Meeting to advance research for Zika and arboviruses, Wellcome Trust, London (UK), 4-6 December 2023
  - Building laboratory networks: Overview of European arbovirus research networks, initiatives, and biorepositories

c) National conferences:

- Microbes, SFM (French Society for Microbiology) annual meeting, Rennes, France, October 2023
  - Network for promoting a One Health approach to mitigate biological risks related to emerging vector borne viruses in the Mediterranean, Black Sea & Sahel regions

- Meeting to advance research for Zika and arboviruses, Wellcome Trust, London (UK), 4-6 December 2023
  - Building laboratory networks: Overview of European arbovirus research networks, initiatives, and biorepositories

d) Other (Provide website address or link to appropriate information):

0
11. What have you done in the past year to advance your area of focus, e.g. updated technology?  
   See section 7

12. Additional comments regarding your report:  
   None
